Order History service — My Account › Order History

One customer-facing history from two systems of record: online orders pushed by Shopify webhooks and in-store sales polled from the Retail POS, merged by one idempotent indexer into a per-customer order store and served through an authenticated read path that never calls either source.

Legend

- synchronous call (caller → callee)
- asynchronous: webhook, publish, consume (producer → consumer)
- line jump: the arrows do not connect
- Datadog — component emits metrics, traces and logs to Monitoring & alerting

- Client
- Edge
- Compute
- Data
- Messaging
- External system of record
- Observability

Requirements this design is held to

- One Order History list inside My Account on the Shopify storefront
- Online (Shopify) and in-store (Retail POS) orders in that one list
- Online orders visible within 1 minute · in-store sales within 5 minutes
- A signed-in shopper sees only their own orders · a guest sees none

Assumed scale (the brief states none): 2,000 concurrent shoppers · 150 req/s at 98:2 read:write
p99 ≤ 300 ms on the history page · 99.9% read-path availability · full order history retained
